Business Requirements | Fleet Maintenance Tracker

Portfolio simulation | Version 2.0 | 25 October 2026

Business need

Maintenance teams need a consistent way to record equipment issues, track outstanding work, and identify overdue items and approvals requiring action. This project demonstrates tracking, automation, and reporting with simulated work orders.

Scope

Included: Excel work-order register and Table, Power Query reporting dataset, summary dashboard and PivotTables, and Power Automate Desktop (PAD) flow that reads records, displays counts, and writes a local text report.

Excluded: Live work orders, email notifications, cloud approvals, multi-user access, and production deployment.

Functional requirements

ID	Requirement
FR-01	Maintain work orders with equipment, issue, priority, assignment, status, dates, and estimated cost.
FR-02	Capture Approval Required and Approval Status separately.
FR-03	Provide a dashboard with work-order volumes, exceptions, and estimated cost.
FR-04	Use Power Query to prepare a reporting dataset; refresh PivotTables for category reporting.
FR-05	Count overdue work orders and actionable pending approvals independently per record.
FR-06	Display results and save a local text summary.
FR-07	Include newly appended work orders in PAD without manually changing the read end row.

Rules and acceptance criteria

Overdue: Count a populated work order when its **Overdue?** field is **Yes**.

Actionable pending approval: Count only when **Approval Required = Yes** AND **Approval Status = Pending**; exclude Pending when approval is not required.

Dynamic rows: PAD finds the first empty row in the Work Order ID column, then reads through the preceding row; this assumes contiguous populated IDs.

Acceptance: Independent checks run for each populated work order; popup and saved report agree. After Excel refresh, the added test row appears in Power Query, and dashboard/PivotTable totals reconcile.

Validation and limitations

Main workbook: 13 records, 8 overdue, 2 actionable pending approvals; popup and saved report checked.

Separate UAT test copy: 14 records detected dynamically by PAD, 0 overdue, 0 actionable pending approvals. Following Refresh All, Power Query contained WO-QA-1014 and dashboard/PivotTable estimated cost reconciled to $13,960.

Testing uses simulated records; results do not establish large-scale performance, unrestricted dynamic row handling, production readiness, or business-user sign-off. Refer to the UAT execution report for test-case evidence.
