UAT Checks | Fleet Maintenance Tracker

Portfolio simulation | Version 2.1 | 25 October 2026

Test basis

Local Excel workbook, Power Query output, Summary dashboard, PivotTable and Power Automate Desktop (PAD). Historical checks began with 10 simulated records; subsequent tests used 13 records in the main workbook and 14 in a separate UAT test copy.

Test cases

ID	Check	Verified result / evidence	Outcome
UAT-01	Read work orders	PAD read 13 main records and automatically detected 14 in the UAT copy.	Pass
UAT-02	Overdue count	Main workbook: 8 overdue out of 13 records.	Pass
UAT-03	Pending approval count	Main workbook: 2 records with Approval Required = Yes and Approval Status = Pending.	Pass
UAT-04	Display summary	Main PAD popup: 13 total / 8 overdue / 2 pending approvals.	Pass
UAT-05	Write report	User confirmed the saved text report matches 13 / 8 / 2 after the main run.	Pass
UAT-06	Independent IF checks	Separate overdue and approval checks; pending approval requires both conditions. Exclusion and zero cases exercised.	Pass - PAD
UAT-07	Dashboard comparison	UAT copy: 14 records on Summary; Power Query includes WO-QA-1014; PivotTable and Summary cost both $13,960. Status totals reconcile to 14.	Pass - UAT copy
UAT-08	Zero-exception cases	UAT copy: 13 / 0 / 2 (zero overdue) and 13 / 0 / 0 (zero pending approvals).	Pass
UAT-09	Additional records	Added WO-QA-1014 in row 15; PAD automatically read 14 records (14 / 0 / 0). Excel Table, Power Query and PivotTable inclusion verified after refresh.	Pass - UAT copy

Evidence and scope

The additional record was tested only in the UAT copy. Screenshots show the PAD 14-record result, refreshed Power Query output containing WO-QA-1014, Summary totals of 14 work orders and $13,960, and a matching $13,960 PivotTable Grand Total. The main workbook remains at 13 records.

Remaining release checks

Before GitHub publication, verify that the uploaded workbook, PAD flow documentation, BRD and repository descriptions agree with the final business rules and tested scope. Live business-user sign-off and a production deployment were not performed.

Test boundary

Simulated portfolio validation only. Overdue counts depend on the execution date and the test data. Passing UAT-07 and UAT-09 refers to the specific 14-record UAT-copy scenario tested, not every possible future dataset.
