Business Requirements | Fleet Maintenance Tracker

Portfolio simulation | Version 1.0 | 14 October 2026

Business need

Maintenance teams need a consistent way to record equipment issues, track outstanding work, and identify overdue items and approvals awaiting action. This project uses a simulated dataset to demonstrate a practical tracking and reporting approach.

Scope

Included: Excel work-order register, Power Query transformation, summary dashboard, and a Power Automate Desktop flow that reads records and writes a local summary report.

Not included: Live work orders, email notifications, cloud approvals, multi-user access, or production deployment.

Key requirements

ID	Requirement
FR-01	Maintain work orders with equipment, issue, priority, assignment, status, dates and estimated cost.
FR-02	Capture approval requirement and approval status.
FR-03	Provide a dashboard showing work-order volumes and exceptions.
FR-04	Use Power Query to prepare a reporting dataset.
FR-05	Count overdue work orders and pending approvals independently for each record.
FR-06	Display results and save a local text summary.

Rules and acceptance criteria

Overdue: Count records where the workbook field **Overdue?** is **Yes**.

Pending approval: Count records where **Approval Status** is **Pending**, regardless of overdue status.

Acceptance: The flow processes the intended records, both IF checks run inside the For Each loop, and the displayed totals match the saved report.

Validation and limitations

On the current sample, the flow returned 10 work orders, 7 overdue, and 1 pending approval; the generated report was checked against those totals. The dashboard was also reviewed.

The workbook and automation use simulated records. Testing does not establish performance on larger datasets or production readiness.
